Hot-in-Place Recycling

Presented by:
Patrick A. Faster
Who is Gallagher Asphalt?

- Founded in 1928
- 3rd-Generation, Family-owned Highway Paving Contractor
- Asphalt Plants throughout the Chicagoland area
- Well-respected and active member of NAPA, ARTBA, NCAT
- Hot-in-Place Recycler for over 35 years
- 3rd Largest HIP Recycler in the U.S.
Who is Chicago Testing Laboratory, Inc.?

- Founded in 1912
- A Full-Service Engineering and Construction Management firm
- Industry leader in QC/QA of asphalt, asphalt materials, liquids, aggregates, concrete and soils
- Provides testing, inspection, training, consulting & research
- Well-respected and active member of NAPA, ARTBA, NCAT
- Provides over 150 years of combined expertise, state-of-the-art facilities and a high degree of professionalism
2012 IDOT Contractor of the Year

Illinois Department of Transportation

October 23, 2012

Mr. Charles J. Gallagher, President
Gallagher Asphalt Corporation
18100 South Indiana Avenue
Thornton, IL 60476

Dear Mr. Gallagher:

Congratulations on your recent nomination for Illinois Department of Transportation's Contractor of the Year Awards in the Hot Mix Asphalt category. The nomination was in recognition of patching and resurfacing along IL 1 (Halsted Street) from 152nd Street to 127th Street in Riverdale, Chicago and Harvey.

I am very pleased to announce the project was selected for the award. The department would like to publicly acknowledge your outstanding performance. A plaque will be presented to you or your firm’s representative at the Illinois Road and Transportation Builders Association’s annual meeting on December 13, 2012, being held at the Hyatt Regency O’Hare in Rosemont. The awards will be presented from 4:30 to 6:00 p.m. in Rosemont Rooms A and B.

Those persons on your staff who are interested in attending the awards ceremony are welcome. Photographs will be taken during this time.

For additional information and tickets to the dinner, you may contact Mr. Michael J. Sturino, Executive Director, Illinois Road and Transportation Builders Association at telephone number (630) 773-1220.

Thank you for your interest in the Illinois transportation system. Once again, congratulations to you and your staff on this outstanding accomplishment.

Sincerely,

Ann L. Schneider
Secretary
ADMINISTRATOR’S MESSAGE:
The National Highway System (NHS) is extensive, with over 160,000 miles of highway pavements and over 128,000 structures, built using large quantities of asphalt, concrete, steel, and aggregate, and smaller quantities of nonferrous metals, plastics, and other materials. Much of the system was constructed in the 1960’s and 70’s and is in need of major rehabilitation or total reconstruction; and much of the materials used to build that system can be recycled for use in the new construction.

In order to carry out the mission of the FHWA, i.e., to “improve the quality of the Nation’s highway system,” the NHS must be properly preserved, maintained, rehabilitated, and when necessary, reconstructed. Maintenance of highways and associated structures is critical to our ability to provide the safest, most efficient roadway system possible, while simultaneously providing the greatest level of protection to the human and natural environment.

The same materials used to build the original highway system can be re-used to repair, reconstruct, and maintain them. Where appropriate, recycling of aggregates and other highway construction materials makes sound economic, environmental, and engineering sense. The economic benefits from the re-use of nonrenewable highway materials can provide a great boost to the highway industry. Recycling highway construction materials can be a cost-saving measure, freeing funds for additional highway construction, rehabilitation, preservation or maintenance.
Congress declares that it is in the national interest to promote the use of innovative technologies and practices that increase the efficiency of construction of, improve the safety of, and extend the service life of highways and bridges… The innovative technologies and practices described in paragraph (1) include state-of-the-art intelligent transportation system technologies, elevated performance standards, and new highway construction business practices that improve highway safety and quality, accelerate project delivery, and reduce congestion related to highway construction… such as… ‘(ii) innovative construction equipment, materials, or techniques, including the use of in-place recycling technology and digital 3-dimensional modeling technologies;

ARRA Sub-categories within the HIR Discipline

- Surface Recycling (ie. Heater Scarification)
- Remixing
- Surface Repaving
Gallagher Asphalt’s Hot-in-Place Recycling Options:

• Surface Recycling (Heater Scarification)
• Re-HEAT
HIR

Where Does IT Fit In?

Re-Construction

Preventive
Typical Grind & Overlay

• Grind to a 2” depth
• Haul grindings away
• Tack course
• Haul leveling course to jobsite
• Place level course
• Roll It
• Haul surface course to jobsite
• Place surface course
• Roll It
What is the Hot-in-Place Recycling SURFACE METHOD?

Hot-In-Place Recycling Surface Method is an on-site, in place, pavement rehabilitation method that consists of heating, scarifying, mixing, replacing and re-compacting the existing bituminous pavement.
Surface Recycling: Step 1

• 1st Pre-Heater takes pavement temp to 180 – 200 degrees
Surface Recycling: Step 2

- 2\textsuperscript{nd} Heater takes pavement temp to 280 – 300 degrees
Surface Recycling: Step 3

- Introduction of rejuvenating agent
Surface Recycling: Step 4

- Spring-loaded tines set hydraulically at prescribed depth will drag over existing structures to avoid damage
Surface Recycling: Step 5

- Full width reversible augers to re-mix
Surface Recycling: Step 6

- Re-profiling with standard paving screed
Surface Recycling: Step 7

- Roller
Open to Traffic...
Surface Recycling: Step 8

The now re-plasticized asphalt is ready to receive its final surface course; such as:

- Hotmix
- Microsurface
- Slurry Surface
- Chip Seal
Rejuvenating Agent Application Rate

Both HIR process will introduce a rejuvenating agent typically at the rate of $1/10^{th}$ gallon per square yard.
Pre-requisites for HIR:

• Pavement must be structurally-sound with no base failures

• Pavement must have at least 3” of hotmix asphalt
What Types of Asphalt Pavements Are Candidates for Hot-in-Place?
Typical Candidates for HIR:

- Thermal Cracking
- Fatigue Cracking
- Patches
- Poor Rideability
- Raveling
NON-Candidates for HIR:
Wisconsin
Minnesota
Oregon
So What Have We Done?
Comparison: # of Truck Trips / Mile

Standard 2 ¼” Mill & Overlay
(215 trucks)

HIR w/ 1” Hotmix Overlay
(53 trucks)
Go Green, Save Green!

• Saves time & reduces “user delays”
• Minimizes the demand on oil & aggregate (non-renewable resources)
• Re-uses/recycles the existing materials – liquid asphalt & aggregates
• Eliminates milling dust & hassles
• Eliminates trucking pollution & traffic
• Reduces carbon footprint by 28-63%
• Uses propane – a cleaner energy source
• Uses a dual stage incineration system to protect air quality during operation
Conestoga-Rovers Carbon Footprint Analysis
Conestoga-Rovers Carbon Footprint Analysis

• Versus Conventional asphalt paving with 20% RAP Hotmix:
  • Heater Scarification emits 28% less GHGs
  • Re-HEAT emits 62% less GHGs
Properties of Recovered Hot In Place Rejuvenated Material
Product Comparison

Chicago Testing Laboratory, Inc.
8/9/2011
CTL Rejuvenator Study

• Samples where taken from an HIR project to represent existing material after the heating process and material after the rejuvenation process

• Results:
  • Air voids improved from 10.1% to 4.9% (3-5% is acceptable)
  • Viscosity & penetration improved over 21%
  • Total bitumen content increased from 4.8% to 5.9% after addition of rejuvenating agent
  • Stability & flow of the compacted material after treatment was statistically the same as prior to treatment
  • Tensile Strength Ratio (TSR) of the material improved nearly 8% and increased the stripping resistance of the pavement from a typically failing test to a passing one
  • Hamburg Wheel Analysis of the rejuvenated sample resulted in a 3.56mm average rut depth (a very rut resistant pavement)
Hamburg Wheel Track Study

Hot In Place Recycled Cores
Rockdale County, Georgia

Chicago Testing Laboratory, Inc.
10/29/2013
• Three sets of core samples were tested per AASHTO T324. Sample A is identified as “IRWIN BR CONTROL”, sample B is “IRWIN BR HIR” and sample C is “OLD COVINGTON HIR.”

• Each set tested to the 20,000 pass duration. The maximum rut measured during the test was measured and is summarized in table 1 below:

<table>
<thead>
<tr>
<th>Sample Number</th>
