

Recommended Practices for Safety and Health Programs in Construction

Source – OSHA

The Recommended Practices are designed to be used in a wide variety of small and medium-sized business settings. The Recommended Practices present a step-by-step approach to implementing a safety and health program, built around seven core elements that make up a successful program.

The main goal of safety and health programs is to prevent

workplace injuries, illnesses, and deaths, as well as the suffering and financial hardship these events can cause for workers, their families, and employers. The recommended practices use a proactive approach to managing workplace safety and health. Traditional approaches are often reactive –that is, problems are addressed only after a worker is injured or becomes sick, a new standard or regulation is published, or an outside inspection finds a problem that must be fixed. These recommended practices recognize that finding and fixing hazards before they cause injury or illness is a far more effective approach.

The idea is to begin with a basic program and simple goals and grow from there. As simple as documenting that employees need to wear personal protective equipment/apparel on the job. Stating your company's policy on purchasing the necessary PPE/apparel. If you focus on achieving goals, monitoring performance, and evaluating outcomes, your workplace can progress along the path to higher levels of safety and health achievement.

Make sure your employees are aware of these policies.

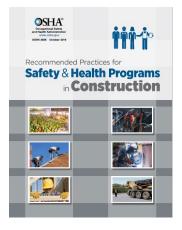

Employers will find that implementing these recommended practices also brings other benefits. Safety and health programs help entities:

- Prevent workplace injuries and illnesses
- Improve compliance with laws and regulations
- > Reduce costs, including significant reductions in workers' compensation premiums
- Engage workers
- > Enhance their social responsibility goals
- Increase productivity and enhance overall business operations
